SECTION A (50 marks)
Answer ALL questions in this section.

QUESTION A1 (5 marks)

The mean diameter of a sample of 200 microchips in computers produced by a machine is 5.02mm and the standard deviation is 0.05mm. The production of microchips allows a maximum tolerance in the diameter of 4.96mm to 5.08mm, otherwise the microchips are considered defective. Determine the percentage of non-defective microchips produced by the machine, assuming the diameters are normally distributed.

QUESTION A2 (5 marks)

The average number of radioactive particles passing through a counter during one millisecond in a laboratory experiment is 4. Find the probability at most one particle enters the counter in a given millisecond.

QUESTION A3 (5 marks)

Suppose that an experiment follows a binomial distribution with mean, $E(X)=2$ and variance, $Var(X)=1.6$. Find the probability of success, p.

QUESTION A4 (5 marks)

A survey of 35 individuals who passed the seven exams and obtained the rank of Fellow in the actuarial field finds the average salary to be $150,000 per year. If the standard deviation for the population is $15,000, construct a 95% confidence interval for the salary of all Fellows.

QUESTION A5 (5 marks)

Noise levels at various areas of urban hospitals were measured in decibels. The mean of the noise levels of a sample of 15 corridors was 61.2 decibels with the standard deviation of 7.9 decibels. Find the 95% confidence interval of the true mean of the noise levels.

QUESTION A6 (5 marks)

The proportion of students in a city that attended private schools is around 11%. A random sample of 450 students indicates that 55 attended private schools. Estimate the true proportion of students attending private schools with 95% confidence.

QUESTION A7 (5 marks)

A random sample of 36 drinks from a soft-drink machine has an average volume of 7.4 milliliters with a standard deviation of 0.48 milliliter. The null hypothesis is given by μ = 7.5 milliliters against the alternative hypothesis μ < 7.5 have been developed to be tested at 0.05 level of significance.

(a) Find the critical value, Z_α.

(2 marks)

(b) Compute the test statistic, Z.

(3 marks)

QUESTION A8 (5 marks)

Male students will spend, on average, \$8 for a Saturday evening fraternity party. The null hypothesis is μ = \$8 against the alternative hypothesis μ ≠ \$8 if a random sample of 12 male students attending the fraternity party gives the test statistic value of $t_c = 1.8815$. State your decision on the rejection of null hypothesis:

(a) at 0.10 level of significance.

(3 marks)

(b) at 0.05 level of significance.

(2 marks)

QUESTION A9 (5 marks)

The following hypotheses are given.

$H_0 : p = 0.45$

$H_1 : p > 0.45$

A random sample of 96 observations gave sample proportion, $\hat{p} = 0.56$.

(a) Find the value of test statistic, Z.

(3 marks)

(b) Find the critical value from standard normal table given that $\alpha = 0.05$.

(2 marks)

<u>QUESTION A10 (5 marks)</u>

A company is considering the following marketing strategies and the corresponding payoff under different economic environments as shown in Table 1.

Table 1. Payoff

	State of nature	
	Good economic environment	Poor economic environment
Strategy P	$200,000	-$150,000
Strategy Q	$100,000	-$80,000
Strategy R	$80,000	-$20,000
Strategy S	$50,000	$30,000

Determine the best strategy using Hurwicz criterion, with the coefficient of optimism, $\alpha = 0.35$.

SECTION B (50 marks)
Answer ALL questions in this section.

QUESTION B1 (25 marks)

(a) A survey was done to determine whether the age of voters was related to the political party they supported during the last election. The data had been taken and gathered in Table 2:

Table 2. Cross tabulation of frequency

Age of Voters	Political Party		
	A	B	C
Young adult	20	30	30
Middle age	20	10	10
Senior citizen	40	20	20

Determine if there exists any significant evidence to conclude that age of voters and the political party they supported are independent. Use $\alpha = 0.05$.

(15 marks)

(b) Due to an unresolved national issue, the popularity of a certain politician is suspected to have decreased over the past year. His popularity vote percentage used to be 55%. To confirm the suspicion, a sample of 820 adult residents is surveyed. The survey reveals that 405 of the respondents still support him. Determine if there exists a significant decrease in his popularity vote percentage. Use significance level of 0.05 to conduct your hypothesis testing.

(10 marks)

QUESTION B2 (25 marks)

(a) An investor is considering three investment sectors: construction, plantation, or health tourism. Profits from the construction or plantation will be affected by the availability of blue-collar workers. Whereas profits from the health tourism will be quite stable. The potential profits on the investments are estimated and tabulated in Table 3.

Table 3. Payoff table.

	Blue-collar workers availability		
Investment	Shortage	Stable supply	Surplus
Construction	-\$80000	\$250000	\$100000
Plantation	\$30000	\$150000	\$100000
Health tourism	\$90000	\$90000	\$80000

Determine the best investment using the following decision criteria.

(i) Maximax criterion.

(2 marks)

(ii) Maximin criterion.

(2 marks)

(iii) Hurwicz criterion (coefficient of optimism = 0.6).

(4 marks)

(iv) Equal likely criterion.

(4 marks)

(b) An outdoor event organiser must decide whether to have the vendors sell sun visors or umbrella. There is a 25% chance of rain, 20% chance of overcast skies, and a 55% chance of sunshine, according to the weather forecast department. The organiser estimates that the following profits will result from each decision, given each state of weather condition as in Table 4.

Table 4. Weather conditions.

Decision	Weather conditions		
	Rain	Overcast	Sunshine
Sun visors	-\$15000	-\$6000	\$45000
Umbrellas	\$60000	0	\$27000

(i) Compute the expected value for each decision and select the best one.

(3 marks)

(ii) Develop the opportunity loss table and compute the expected opportunity loss for each decision and determine which decision is the best.

(6 marks)

(iii) Without further calculation, write down the expected value of perfection information (EVPI).

(4 marks)

FORMULAE AND TABLES

(a) Binomial Distribution

$$P(X = x) = {}^{n}_{x}C . p^{x} . (1-p)^{n-x}, x = 0, 1, \ldots, n$$

Where

p is the probability of success in single trial

n is the number of trials

Mean of a Binomial distribution, $E(X) = np$

Standard deviation of a Binomial distribution, $\sigma = \sqrt{np(1-p)}$

(b) Poisson Distribution

$$P(X = x) = \frac{e^{-m} \times m^{x}}{x!}, x = 0, 1, \ldots$$

Where

m represents the mean

Mean of a Poisson distribution, $E(X) = m$

Standard deviation of a Poisson distribution, $\sigma = \sqrt{m}$

(c) Normal Distribution

$$Z = \frac{X - \mu}{\sigma}$$

Where

Z is the number of standard deviation from the mean

X is the value of interest

Mean of a Normal distribution, $E(X) = \mu$

Standard deviation of a Normal distribution, $\mathrm{sd}(X) = \sigma$

(d) Sampling Distribution

(i) Standard error of mean

$$se(\overline{X}) = \frac{\sigma}{\sqrt{n}}$$

Where

σ is the standard deviation for the population

n represent the sample size

OR

$$se(\overline{X}) = \frac{s}{\sqrt{n}}$$

Where

s is the standard deviation for the sample

n represent the sample size

(ii) Standard error of proportion

$$se(\hat{p}) = \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$$

(e) Confidence Interval

(i) Confidence interval for μ: = $\overline{X} \pm t_{\frac{\alpha}{2}, n-1}\left(\frac{s}{\sqrt{n}}\right)$

Sample size: $n = \left(\frac{Z_{\alpha/2} \times \sigma}{e}\right)^2$

(ii) Confidence interval for p: $\hat{p} \pm Z_{\frac{\alpha}{2}}\left(\sqrt{\frac{\hat{p}\hat{q}}{n}}\right)$

Sample size, $n = \frac{(Z_{\alpha/2})^2 \times \hat{p}\hat{q}}{e^2}$

(f) Hypothesis Testing:

(i) Hypothesis testing for μ: t = $\frac{\overline{X} - \mu}{s/\sqrt{n}}$

(ii) Hypothesis testing for p: Z = $\frac{\hat{p} - p}{\sqrt{\frac{pq}{n}}}$

(iii) Non-parametric testing: $\chi^2 = \sum \frac{(O - E)^2}{E}$

(g) Decision Making Techniques

(i) Expected Value:

$$EV(i) = \sum_{j=1}^{N} P_j X_{ij}$$

(ii) Expected Opportunity Loss:

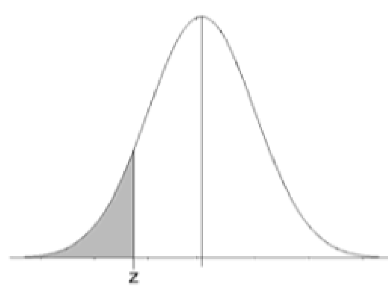
$$EOL(i) = \sum_{j=1}^{N} P_j L_{ij}$$

(iii) Expected Value of Perfect Information:

$EVPI$ = Expected value under certainty – expected value under uncertainty

STANDARD NORMAL CUMULATIVE PROBABILITY TABLE

Cumulative probabilities for NEGATIVE z-values are shown in the following table:



z	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
