

# **System Development Methods**

**CT00046-3-2**

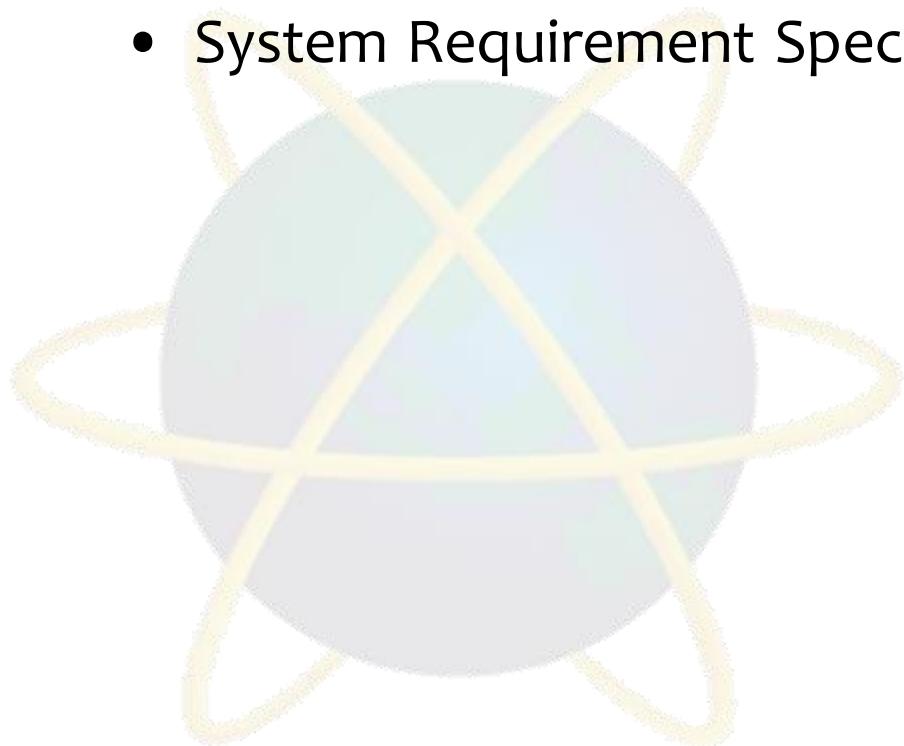

**A • P • U**  
ASIA PACIFIC UNIVERSITY  
OF TECHNOLOGY & INNOVATION

## **System Development Planning**

**Part 2**

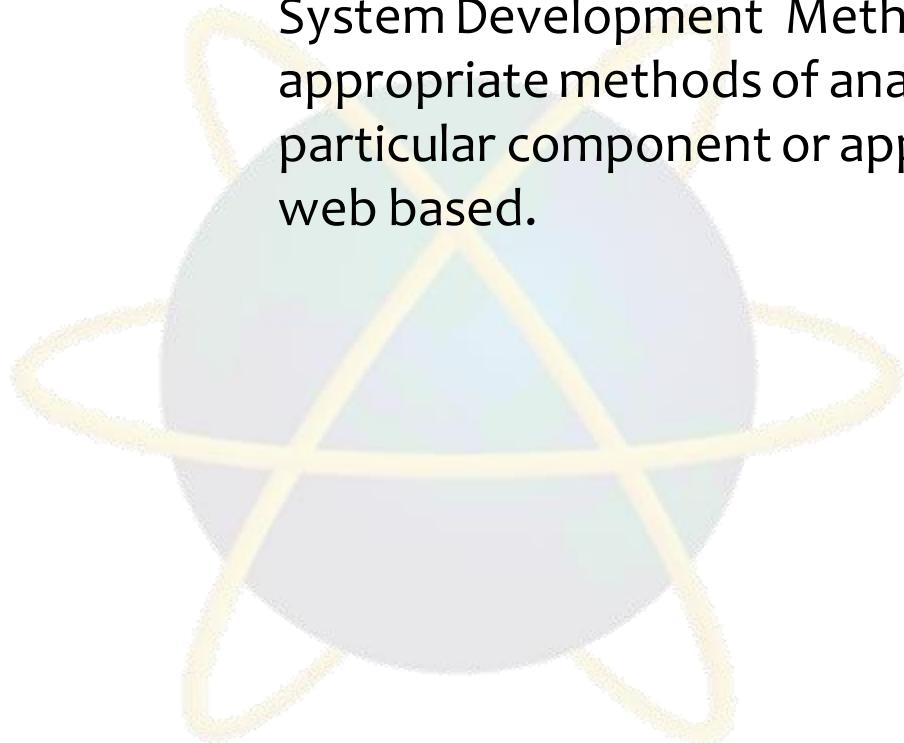

# Topic & Structure of the Lesson

- Requirement Engineering
  - Stages
- Review Facts Finding Methods
- System Requirement Specifications (SRS)

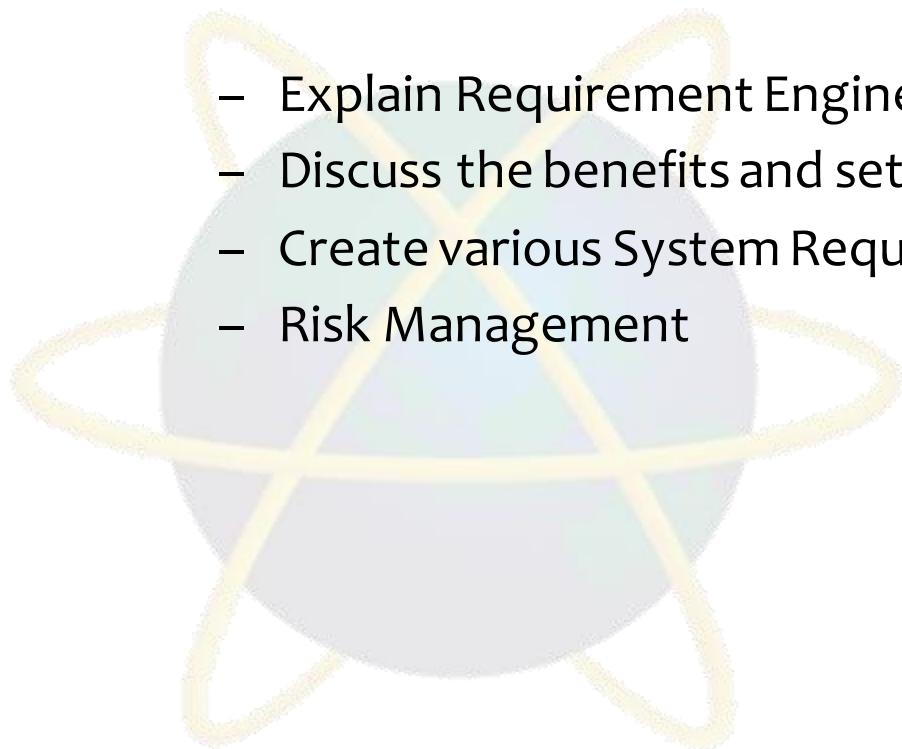

# Learning Outcome

- At the end of the module, you should able to:
  - Explain the purpose, structure and scope of modern Information System Development Methodologies and select and justify appropriate methods of analysis, design and implementation for a particular component or application, be it traditional, multimedia or web based.

# Key Terms you must be able to use

- If you have mastered this topic, you should be able to use the following terms correctly in your assignments and exams:
  - Explain Requirement Engineering stages
  - Discuss the benefits and setbacks of various Facts Finding Methods
  - Create various System Requirement statements.
  - Risk Management

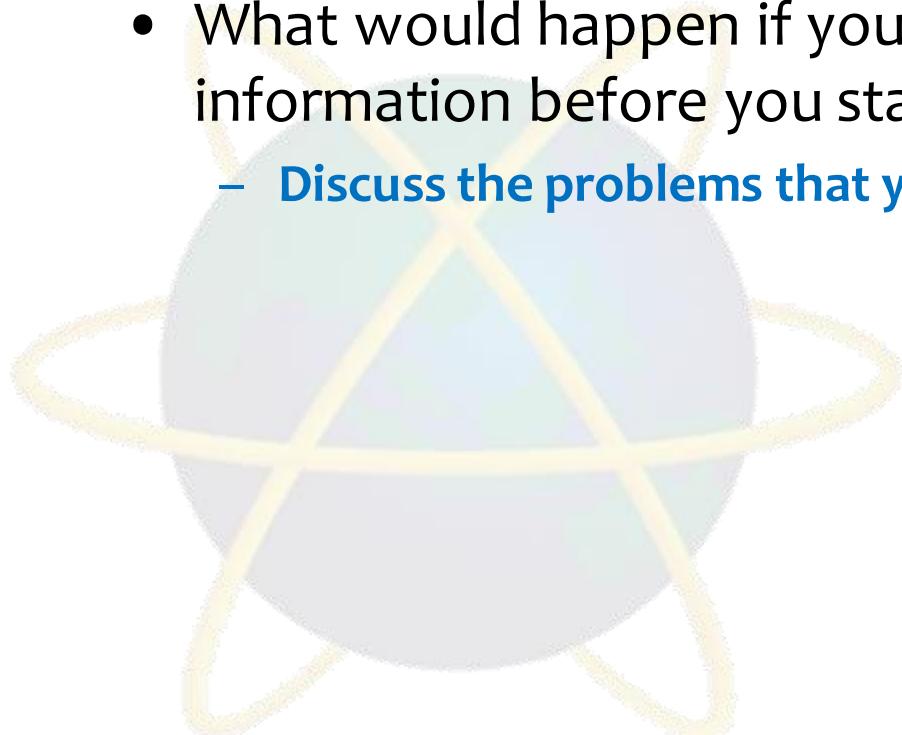

# Information System Requirements

- Requirements
  - A guideline of what the new IS should do to archive its objectives.
- High Level Requirement.
  - Overall goal of the system.
  - Determined at initial planning stage by the analyst
- Low Level Requirements
  - More detailed functions
  - Determined by gathering requirements from varies sources.
  - Later tuned into **Systems Requirement Specifications (SRS)**

# Quick Quiz

- What would happen if you don't collect enough / accurate information before you start your project?
  - **Discuss the problems that you would face later.**

# Requirement Engineering

## Main Activities ... a review

- RE - Process of gathering, analyzing and finalizing requirements for the project.
  - AKA; Requirement Gathering, System Investigation.
- Requirement Elicitation (Requirement gathering)
  - Collect data about the old system and the new system to be built
- Requirement Compilation
  - Gathering / merging the collected data into one location
- Requirement Validation and Analysis
  - Narrowing / filtering, keeping only important and achievable requirements.
- Output
  - **System Requirement Specification (SRS)**

# Requirement Engineering (RE)

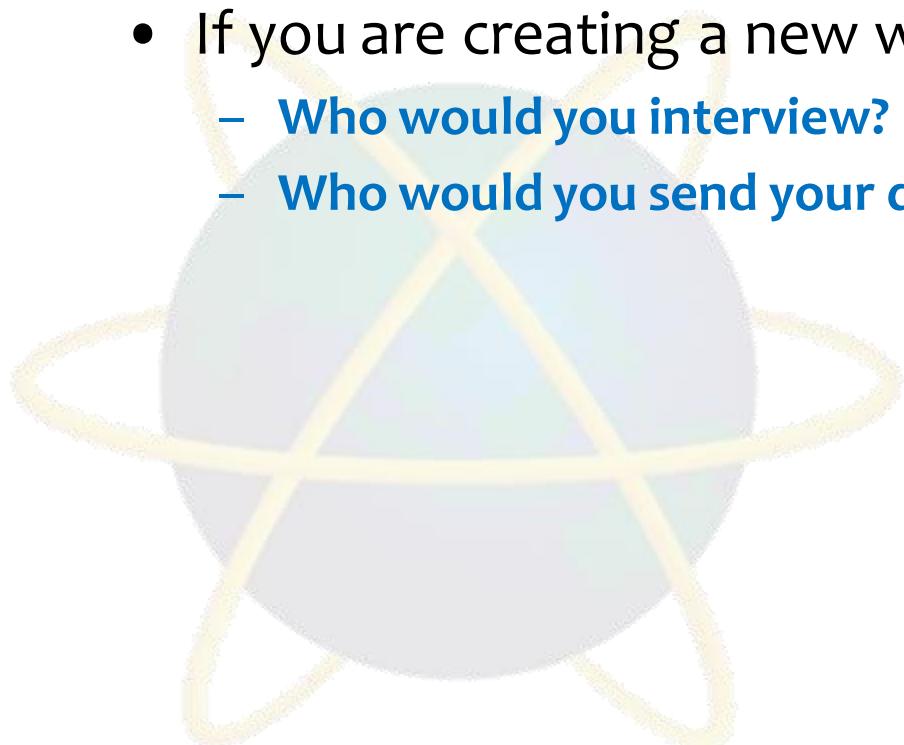

- Basically asking the following questions to gather facts,  
WHO, WHAT, WHERE , WHEN, HOW , WHY.
- Popular RE Techniques;
  - Interview
  - Questionnaires / Survey
  - Observation
  - Document Review
  - Data Mining
  - Brainstorming
  - Focus Group
    - A focus group is a group interview involving demographically similar people or participants with common traits/experiences.
  - etc

“One accurate measurement is worth a thousand expert opinions.”  
(Utvich's Law)

# Quick Quiz

- If you are creating a new website for APU;
  - Who would you interview?
  - Who would you send your questionnaires?

# System Requirement Specifications (SRS)

- Structured collection of information that contains the finalized requirements of a system
- Contains finalized requirement for System Design
- Popular Requirement groups;
  - Functional Requirements
  - Non-Functional Requirements
  - Architecture Requirements
  - Business Requirements
  - System / Technical Requirements
  - User / Stakeholders Requirements
  - Security Requirements
  - User Interface Requirements, etc

# Risk Management

11-04-17

- Process of identifying potential risk to the project / products and getting prepared for it.
- Many projects failed due to;
  - Developer did not identifying all risks
  - Developer Ignoring risks
  - Developer did not prepare ‘backup plan’ for risk
  - Developer did not monitor risk.

# Risk Management Process

# Risk Management Model

- Risk is the product of **Probability vs impact**  
(Risk = Probability X Impact)

		<b>Probability</b>		
		<b>Low</b>	<b>Medium</b>	<b>High</b>
<b>Impact</b>	<b>Severe/Critical</b>	Substantial management required	Must monitor and manage risks	Extensive management crucial
	<b>Moderate</b>	May accept risks but monitor them	Management effort useful	Management effort required
	<b>Limited/Minor</b>	Accept risks	Accept risks but monitor them	Monitor and manage risks

# Risk Management Strategies

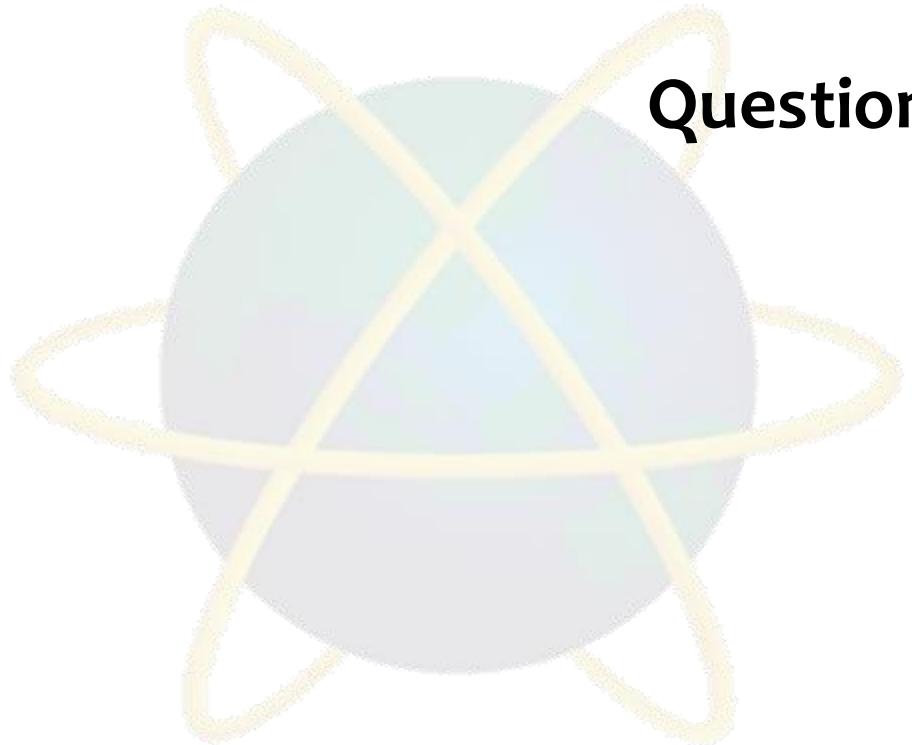

- Risk Transfers
  - Accept that the risk **MAY** happen. Transferring the risk to a vendor or customer (who are aware of the risk but willing to face it if it comes).
- Risk Avoidance
  - Accept that the risk **MAY** happen and taking alternative path to avoid the risk from happening.
  - Original design may change.
- Risk Reduction
  - Accept that the risk **WILL** happen and taking additional steps to reduce the risk from occurring.
  - May increase cost and delay in delivery time.
- Risk Acceptance
  - Accept that the risk **WILL** happen and implement total solution.
  - Costly and time consuming.

# Summary of Main Teaching Points

- RE Stages
- Fact-finding techniques
- SRS
- IT Risk Management

## Question & Answer

# Next Session

- System Analysis – Methods and Tools

# Tutorial

1. Individual Work;
  - a) For EACH Requirement Gathering Methods, explain a situation where it CAN BE USED and NOT SUITABLE TO BE USED.
  - b) Design a simple **questionnaire** (using the Likert-scale format) to find out the effectiveness of Webspace-2 in APU.

## 2. Group work;

Webspace-2 was built on various requirements.

- a) Write 2 requirement statements for each TYPES you studied here, for Webspace-2
- b) Identify the RISKS involved if you are given a project to upgrade Websapce-2. Show the risk in the Risk Analysis Table.
